

ACID STAIN SYSTEM

Our Acid Stain System enhances the look of old and new concrete surfaces with rich, deep, and translucent tones, giving character to ordinary, dull concrete. Create the look of marble, weathered leather, natural stone or seascape blues and greens. Concrete Solutions stain has endless colour possibilities and multi-hued colour effects.

Acid Stain has long been popular among homeowners, business owners and architects because it provides a unique alternative to traditional types of flooring.

- Can be applied over existing concrete and polymer concrete overlays
- Adds colour while maintaining concrete's texture
- Reactive penetrating stain
- Variety of rich, complementary colours

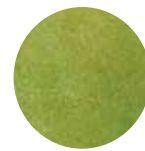

Our Acid Stain System uses the chemical reaction between blended metallic salts in the stain and the hydrated lime in the hardened concrete to create stunning colour and original concrete designs. Combined with one of our clear coats, the system is a superior decorative concrete solution that provides surface protection and enhances the look and feel of ordinary flooring.
